Full stack developer with 3+ years of experience building backend services in Node.js and TypeScript and apps in React and React Native. At Mulyam I build and run the order, payment and delivery systems behind a grocery delivery business.

Experience

Mulyam (ImFresh) Feb 2024 – Present
Full Stack Developer *Remote, India*

- Built the backend in TypeScript with Node.js, Express, TypeORM and PostgreSQL: orders, payments, inventory, delivery and invoicing across 23 modules (about 29,000 lines). It serves 5 production apps, including the customer website, two mobile apps and an admin dashboard.
- Set up a Turborepo monorepo with 16 shared packages for auth, permissions, UI, validation and database code, which cut duplicated code by 40%.
- Built two React Native (Expo) apps for iOS and Android with Firebase login, push notifications, Razorpay payments and Crashlytics.
- Built the admin dashboard (27 modules) in React, Material UI and Redux Toolkit, with role based access for staff.
- Deployed the services on GCP Compute Engine with Docker and Firebase Hosting, with separate dev, QA and production environments.
- Built an agricultural cooperative platform (Expo app and Next.js web, Drizzle ORM, PostgreSQL, Zod) in a second monorepo, and reworked its CI with remote caching and affected only builds: local builds 50% faster, CI time down from 13 to 7.5 minutes.

Stealth Mode Startup Aug 2023 – Feb 2024
Full Stack Developer *Remote, India*

- Built a web application end to end with Next.js, PostgreSQL and RTK Query, including 15+ REST API endpoints.
- Reworked the database schema and slow queries, bringing average API response time down by 25%.
- Built the frontend with Tailwind CSS and ShadCN UI and used server side rendering and code splitting to make pages load 30% faster.

SBFC Finance May 2020 – Aug 2020
Software Development Engineer Intern *Remote, India*

- Built an internal LMS style dashboard for 50+ employees, improving data comprehension by 10x.

Projects

GitHub Tracker | *Go, GitHub GraphQL API, JavaScript* Source

- A local dashboard showing commits, pull requests, reviews, CI status and milestones across all my repositories. It is a single Go binary with the UI embedded, fetches repos in parallel with batched GraphQL queries, caches results and stays within GitHub's rate limits.

MusicKart | *React, Node.js, Express, MongoDB* Source

- An online headphone store with a REST API for login, products, cart, orders and feedback. Filtering, sorting and search run on the server, and checkout creates an invoice for each order.

Kan-Hub | *React, Node.js, Express, MongoDB* Source

- A Kanban board with login, tasks with checklists, priorities and due dates, and a stats page built on MongoDB aggregation queries.

Skills

Languages: TypeScript, JavaScript, SQL, Go

Backend: Node.js, Express, NestJS, REST APIs, TypeORM, Drizzle ORM, Mongoose, Zod, JWT

Frontend: React, Next.js, React Native, Expo, Redux Toolkit, RTK Query, Tailwind CSS, Material UI

Databases: PostgreSQL, MongoDB, MySQL, Firestore

Cloud and tools: GCP, Docker, Firebase, GitHub Actions, Turborepo, pnpm, Git, Razorpay, Google Maps API

Education and Other

University Institute of Engineering and Technology, MDU Rohtak, India
B.Tech in Computer Science and Engineering *July 2023*

Open source contributions to OpenShift Docs, Mattermost, Meshery and Moja Global. Web development articles on GeeksforGeeks with 100,000+ views.
